

Here we're connected to the website with the Bob (consumer) account

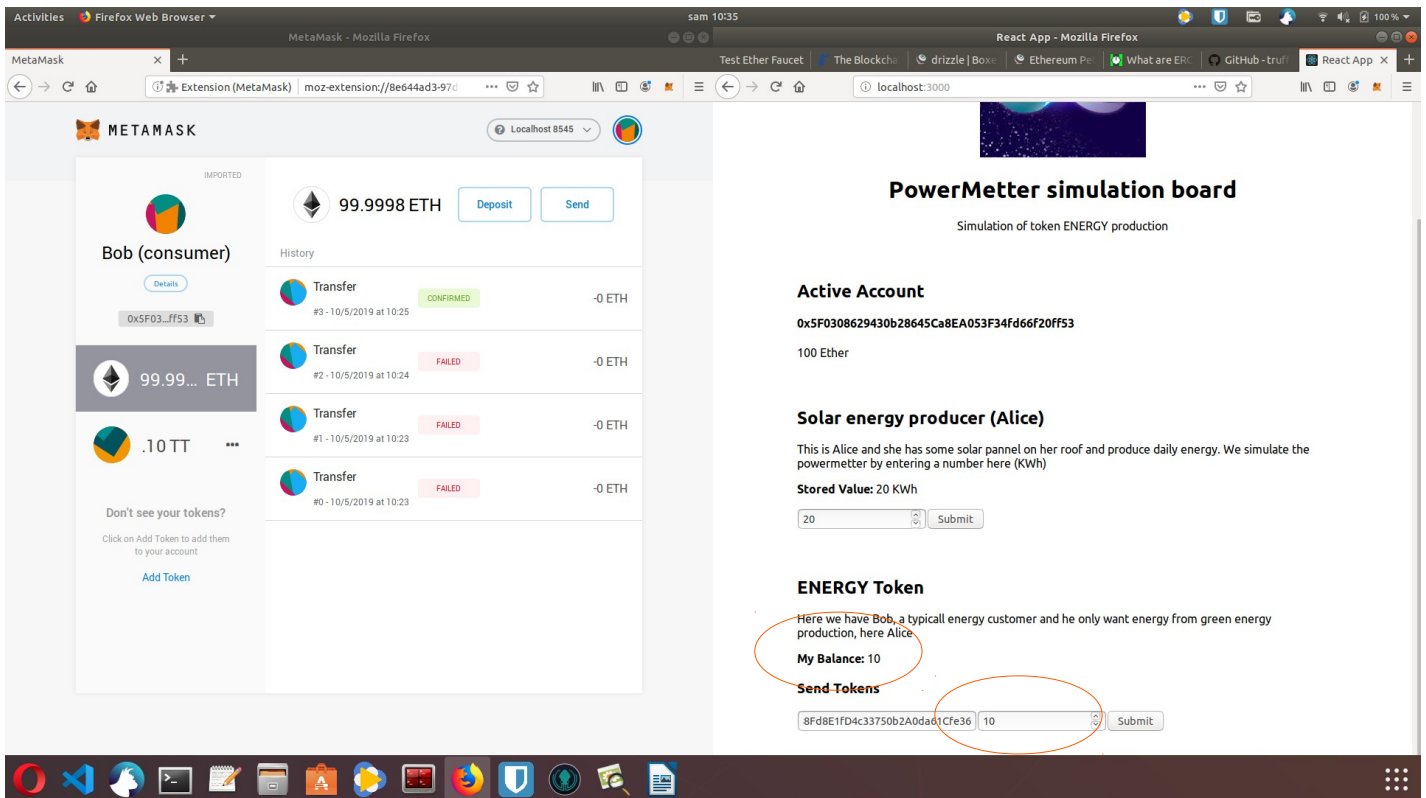

And here we're connected with Alice (producer) account

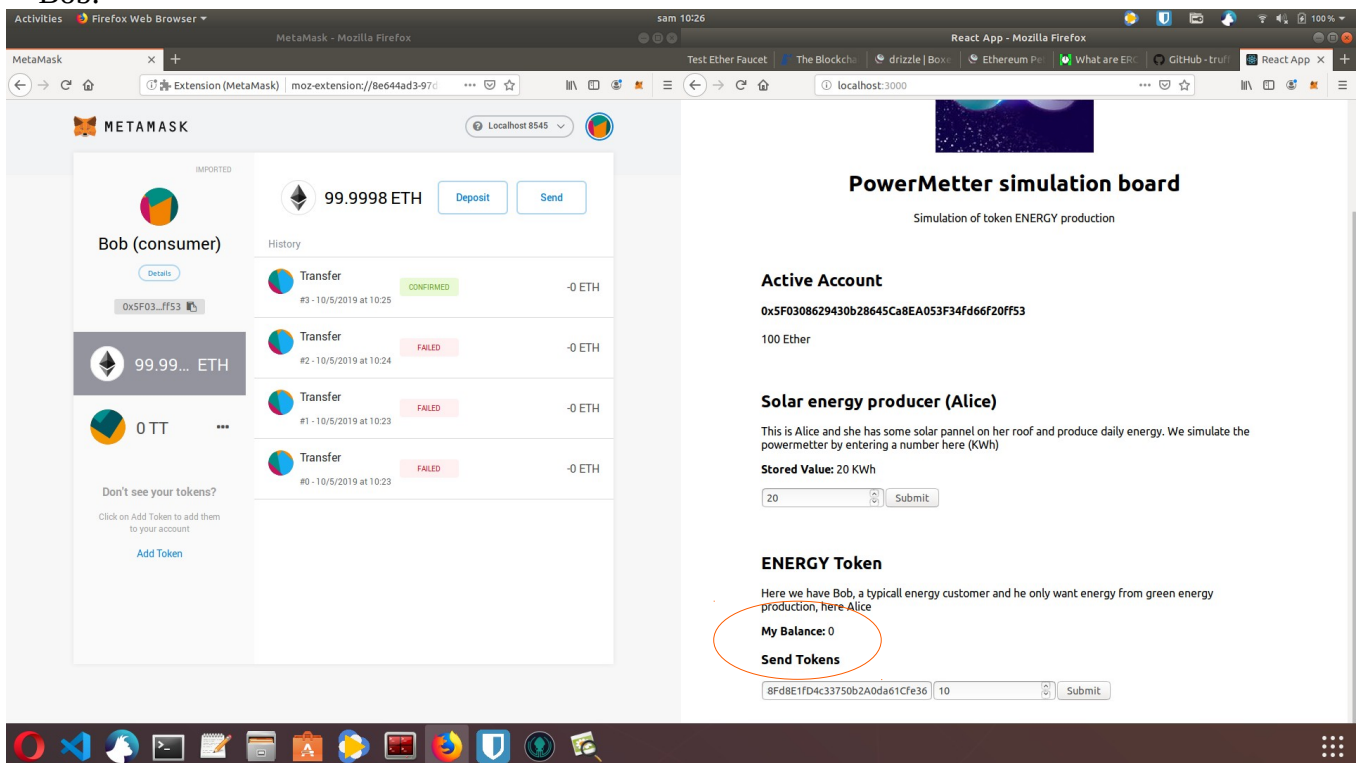

Here we're saying to the blockchain that Alice just produced 20 Kwh of green energy, the transaction is saved and need some gas to execute.

Here we can see that the transaction just got confirmed, so we saved that alice produced 20 Kwh of green energy.

Here, we're connected with Bob, we're trying to buy some electricity to Alice with token, so we send 20 token to Alice's public address, the transaction got created but it needs to be accepted by Bob.

Here, we can see that Bob's balance just went to 0 token, he just sent his 10 last token to Alice.
